DECIPHERING THE ROLE OF RUNX1 ISOFORMS IN THE DEVELOPMENT OF TRANSIENT ABNORMAL MYELOPOIESIS

Conclusion: Our Hsa21-wide CRIPSR-Cas9 screening in combination with functional validation in vitro and in vivo places a specific RUNX1 isoform in the center of an interaction network with mutated GATA1s during the transformation of fetal HSPCs in the background of trisomy 21. Our data highlight the importance of alternative splicing in leukemias and will guide the development of truly specific and targeted therapies.
